```

this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosts of botulism. The transformed host calls can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formallin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only so if the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. Sequences AARST212.7317 represent synthetic DNA sequences encoding BONT He fragments used in the present invention. These were optimised for codon usage for expression in yeast.

Clostridium botulinum isolate 588 type B cryptic neurotoxin gene,
                                                                                                                                                                                                                                           Bacteria; Firmicutes; Bacillus/Clostridium group; Clostridiaceae;
                                                                                                                                                                                                                                                                                      1 (bases 1 to 3876)
Kirma, N., Ferretara,J.L. and Baumstark,B.R.
Characterization of six type A strains of Clostridium botulinum
that contain type B toxin gene sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Direct Submission

Clostridium botulinum isolate 13280 type B cryptic neurotoxin-like
                                                                                                                                                                                                                                          clostridium botulinum
Bacteria; Firmicutes; Bacillus/Clostridium group; Clostridiaceae;
Clostridium.
1 (bases 1 to 3869)
Krima, N., Ferreira, J.L. and Baumstark, B.R.
Characterization of six type A strains of Clostridium botulinum
that contain type B toxin gene sequences

Nucleotide sequence of the gene coding for Clostridium botulinum
(Clostridium argentinense) type G neurotoxin: genealogical

comparison with other clostridial neurotoxins

L Blochim. Blophys. Acta 1216 (3), 487-491 (1993)

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BoNTA-BONTG). The vaccine of the invention is novel recombinant of G (BoNTA-BONTG). The vaccine of the invention is novel recombinant by construct comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a venezuelan equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein a venezuelan equine encephalitism. (VEE) replicon vector used to produce vaccines against botulism. The proteins can also be used as to produce used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only pastingly for a better immune response. Sequences AASINIT-EARTHON. The novel vaccine of overcomes thase problems, as it is easily purified, and avacine of overcomes thase problems, as it is easily purified, and avacine of overcomes thase problems, as it is easily purified, and avacine of overcomes thase problems, as it is easily purified, and avacine of avacine response. Sequences AASINIT-ZBNIT represent synthetic DNA sequences encoding BONT Hc fragments used in the present invention. These were optimised for codon usage for expression in yeast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A \cdot G_i is used for inducing an immune response against

New nucleic acids encoding the carboxy- or amino-terminal portions the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism

Claim 2; Fig 4a; 73pp; English.

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain which consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coll or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producting bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can derived from Clostridium botulinum serotypes A-G

```
This is the DNA sequence of the Clostridium botulinum serotype B (Danish strain) toxin fragment C gene contained in plasmid pETHisb. The encoded fragment C polypeptide (see AAW68394) has a His-tagged C The encoded fragment. The vector was used to express native (i.e. non-fusion) soluble C fragment in Escherichia coli host cells. The invention relates to recombinant proteins derived from C. C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant toxins are E. coli, insect cells and yeast cells. The recombinant toxins are useful in the treatment of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                             seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA1998.DAT:AAV30581
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antitoxin; vaccine; neurotoxin; toxin B; intoxication; immunogen;

Charles strain; total gene that codes for a 1291-main course. Consists strain; total gene that codes for a 1291-main could be polypeptide (see AAW68392). The C fraqment (see AAW68394) of the boxin has been expressed as histidine-tagged protein in Escherichia coli host cells. The invention relates to C. botulinum recombinant toxin polypeptides. Methods are provided which allow for the alsoluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of the recombinant proteins are E. coli, insect cells and yeast cells. The recombinant proteins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin
                                                                                                                                                                                                        This is the coding region of the Clostridium botulinum serotype B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  34

chain and then posttranslationally nicked, forming a dichain consisting of a 100 kba heavy chain and a 50 kba light chain which consisting of a 100 kba heavy chain and a 50 kba light chain which carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant cerpression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes to protective immunity against botulinum neurotoxin, which causes of botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coll or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing to bacterium, production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of

This is the DNA sequence of the Clostridium botulinum serotype B toxin fragment C gene contained in plasmid pHisBotb. The encoded fragment C polypeptide (see AAW68393) has a histidine-tagged of Tragment C polypeptide (see AAW68393) has a histidine-tagged of Tragment in Escherichia coli host (i.e. non-fusion) soluble C fragment in Escherichia coli host cells. The invention relates to recombinant proteins derived from C to botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are B. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
                                                               Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin
Host cell containing recombinant expression vector encoding
                                                                                                                                                                                                                                           Example 35; Page 300-302; 428pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               234
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            267
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            284
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes a recombinant neurotoxin protein from the present invention. The present invention describes recombinant neurotoxin proteins which comprise a first and second domain, where the first domain is adapted to cleave one or more vesicle or plasma-membrane associated proteins essential to exocytosis, and where the second domain is adapted; (a) to translocate the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein compared to the solubility of the first domain on its own, the protein compared to the solubility of the first domain on its own, the protein compared to the solubility of the first domain on its own, the protein can be converted into toxin by proteolytic action. The recombinant proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of functional botulinum or tetanus neurotoxins either in foodstuffs or in environmental samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant neurotoxin polypeptides - used to develop therapeutic agents, immunogens or as non-toxic standards for the detection of neurotoxins

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BONTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid ragment comprising a vector, and at least one nucleic acid ragment comprising a vector, and at least one nucleic acid response acid in the vector is a venezuelan equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as closed as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the replient. Also, the vaccine is incomplete, in that only of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the Imph nodes for a better immune response. Sequences AAR87212-Z87217 represent

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) can amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy capression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes:

Conception of the caids are advantageous since it eliminates of recombinant nucleic acids are advantageous since it eliminates contains such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acids encoding the carboxy- or amino-terminal portions of the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  189

This is the DNA sequence of the Clostridium botulinum serotype G (113/30 strain) neurotoxin fragment C gene contained in plasmid pETHISD. The encoded BotG fragment C polypeptide (see AAW68400) has a His-tagged N-terminal extension. The vector can be used to express native (i.e. non-fusion) soluble C fragment in Escherichia coli host cells. The invention relates to recombinant proteins derived from C. botulinum toxins, especially type B and type E toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are
                                                                                                                                                                                                                                                                                                                                  seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA1998.DAT:AAV30596
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin - useful to treat humans and other animals at risk of intoxication with clostridial toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antitoxin; vaccine; neurotoxin; toxin G; intoxication; immunogen; botulism; BotG; ds.

Dertzbaugh MT,

Parker M,

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BONTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BONT serotypes A-G. In preferred embodiments of the invention, the vector is a ventor results in the production of large amounts of a protein encoded by vector results in the production of large amounts of a protein encoded by vector results in the production of large amounts of a protein encoded by vector results in the production. The constructs are used to produce vaccines against botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine controllers is also expressed in the lymph nodes for a better immune response. The present sequence represents by an exemplification of

```
consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes contuism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coll or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 184 lealaAsnGlyGluIleIlePheLysLeuAspGlyAspIleAspArgThr 200

Chain and then posttranslated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain chain and then posttranslationally nicked, forming a dichain which consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or anno-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes coulism. The nucleic acids are expressible in a recombinant or granisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered production is also high and cost of production is lower. The nucleic acids can be derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acids encoding the carboxy· or amino-terminal portions the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism
             Botulism; toxin; neurotoxin; heavy chain; recombinant expression; recombinant vector; antigen; immune response; vaccine; bacterium;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4 LysTyrAsnSerGluIleLeuAsnAsnIleIleLeuAsnLeuArgTyrLy 20

```
A synthetic gene (AAT29245) codes for the heavy.chain C fragment (AAR95008) of Clostridium botulinum type A neurotoxin (see also AAR95010). Codon usage allowing efficient gene expression in Escherichia coli was utilised. The gene in vector palterBot was used to make expression constructs in which fragments of C difficile toxin A repeat domains were expressed as genetic fusions with the C. botulin C fragment and expressed in E. coli.
to treat C. difficile intoxication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         277
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         468
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         167

Clostridium botulinum serotype A.

botulism; ds

```
This is the DNA sequence of the Clostridium botulinum serotype A toxin C-fragment gene contained in plasmid palterBot. Recombinant C-fragment proteins have been produced in Escherichia coli as fusion proteins with either maltose binding protein or clostridium difficile type A toxin (see AAW68387). The invention relates to recombinant proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins fere of significant endotoxin contamination. Preferred hosts for production of recombinant toxins are E. coli, insect cells and yeast cells. The recombinant toxin proteins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Host cell containing recombinant expression vector encoding Clostridium botulinum type B or E toxin · useful to treat humans and other animals at risk of intoxication with clostridial toxin
